

Project 3 in Linear and Logistic Regression

El-Tayeb Bayomi, Nora Lüpkes

Lund University

May 27, 2020

Purpose and expectations of this project

- COVID-19
- Implementing what we have learnt throughout the course.
- Train presenting your independent work.

- obs_date, **The date (in R date format).**
- day_nbr, **Consecutive day number.**
- day_nbr_region, **Consecutive day number within region.**
- region **The name of the region.**
- population, **The population size.**
- new_cases, **the number of new confirmed cases.**

Raw data

Model:

`new_cases ~ (day_nbr_region) * (day_nbr) * obs_date + region`

population as offset variable

Family = negative binomial or poisson ?

Model:

`new_cases ~ (day_nbr_region) * (day_nbr) * obs_date + region`

population as offset variable

Family = negative binomial

	Df	BIC
none		110323
- day_nbr_region:day_nbr:obs_date	1	110567
- region	19	131846

Model:

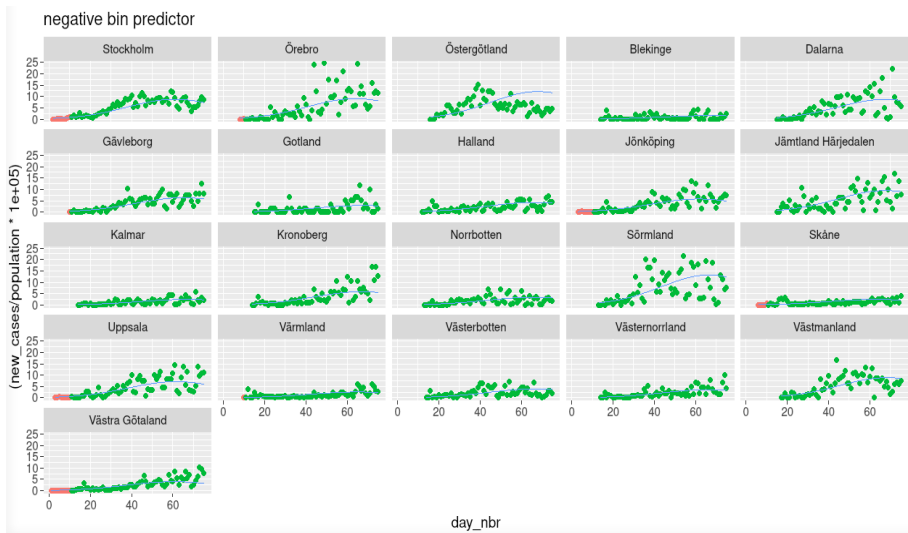

```
new_cases ~ (day_nbr_region) * (day_nbr) * obs_date + region
```

population as offset variable

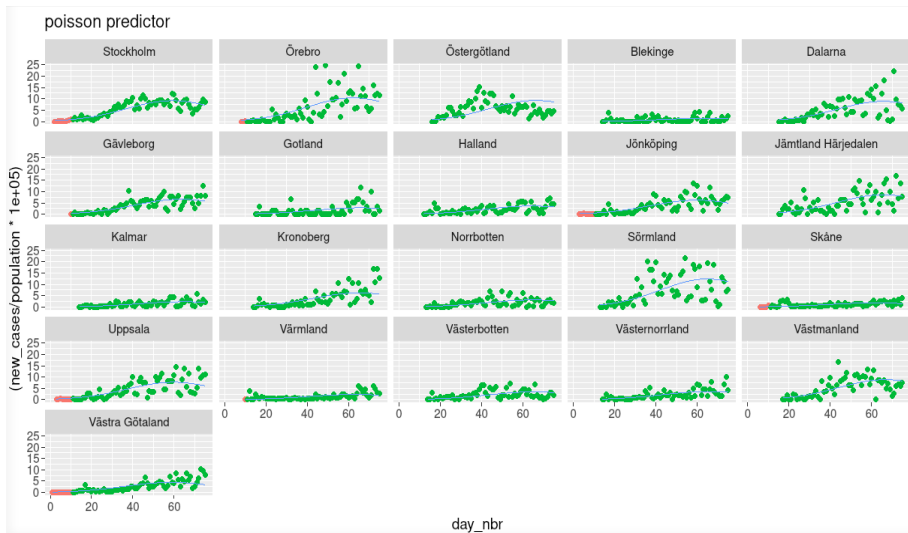

Family = negative binomial

	Df	BIC
none		110323
- day_nbr_region:day_nbr:obs_ date	1	110567
- region	19	131846

Negative binomial predictions

Poisson predictions

Negative binomial - Deviance standardized residuals

Deviance standardized residuals - Stockholm

```
roc.test(mod_po.roc, mod_nb.roc)
```

AUC of Poisson	AUC of negative binomial
0.5932225	0.6014123

Östergötland - continuing work?

Östergötland - continuing work?

Fit a Gaussian curve

Code:

```
library(fitdistrplus)
FIT <- fitdist(fhm.data.og$new_cases, "norm")
class(FIT)
plot(FIT)
```

Östergötland - continuing work?

Empirical and theoretical dens.

Östergötland - continuing work?

Peak present?

\Rightarrow Choose model family

Thank you!
